TSwap Audit Report

Cryptic Defense

January 19th, 2024

Prepared by: Cryptic Defense Lead Security Researcher: - Cryptic Defense

Table of Contents

    * [M-1] `TSwapPool::deposit` is missing deadline check causing transactions to complete even after the deadline
  - Low
    * [L-1] `TSwapPool::LiquidityAdded` event has parameters out of order causing event to emit incorrect information
  - Informationals
    * [I-1] `PoolFactory::PoolFactory__PoolDoesNotExist` is not used and should be removed
    * [I-2] Lacking zero address checks

Protocol Summary

This project is to enter a raffle to win a cute dog NFT. The protocol should do the following:

1. Call the `enterRaffle` function with the following parameters:
    1. `address[] participants`: A list of addresses that enter. You can use this to enter yourself multiple times, or yourself and a group of your friends.
2. Duplicate addresses are not allowed
3. Users are allowed to get a refund of their ticket & `value` if they call the `refund` function
4. Every X seconds, the raffle will be able to draw a winner and be minted a random puppy
5. The owner of the protocol will set a feeAddress to take a cut of the `value`, and the rest of the funds will be sent to the winner of the puppy.

Disclaimer

The Cryptic Defense team makes all effort to find as many vulnerabilities in the code in the given time period, but holds no responsibilities for the findings provided in this document. A security audit by the team is not an endorsement of the underlying business or product. The audit was time-boxed and the review of the code was solely on the security aspects of the Solidity implementation of the contracts.

Risk Classification

		Impact		
		High	Medium	Low
	High	H	H/M	M
Likelihood	Medium	H/M	M	M/L
	Low	M	M/L	L

We use the CodeHawks severity matrix to determine severity. See the documentation for more details.

Audit Details

The findings described in this document correspond the following commit hash:

```
e643a8d4c2c802490976b538dd009b351b1c8dda
```

Scope

```
./src/
#-- PoolFactory.sol
#-- TSwapPool.sol
```

Roles

- Liquidity Providers: Users who have liquidity deposited into the pools. Their shares are represented by the LP ERC20 tokens. They gain a 0.3% fee every time a swap is made.
- Users: Users who want to swap tokens.

Executive Summary

In this audit, Foundry was utilized to identify a total of seven bugs.

Issues found

Severity	Number of issues found
High	3
Medium	1
Low	1
Info	2
Total	7

Findings

High

[H-1] Incorrect fee calculation in `TSwapPool::getInputAmountBasedOnOutput` causes protocol to take too many tokens from users, resulting in lost fees

Description: The `getInputAmountBasedOnOutput` function is intended to calculate the amount of tokens a user should deposit given an amount of output tokens. However, the function currectly miscalculates the resulting amount. When calculating the fee, it scales the amount by 10_000 instead of 1_000.

Impact: Protocol takes more fees than expected from users.

Recommended Mitigation:

```
    function getInputAmountBasedOnOutput(
        uint256 outputAmount,
        uint256 inputReserves,
        uint256 outputReserves
    )
        public
        pure
        revertIfZero(outputAmount)
        revertIfZero(outputReserves)
        returns (uint256 inputAmount)
    {
        return
-           ((inputReserves * outputAmount) * 10000) /
+           ((inputReserves * outputAmount) * 1000) /
            ((outputReserves - outputAmount) * 997);
```

```
16      }
```

[H-2] Lack of slippage protection in `TSwapPool::swapExactOutput` causes users to potentially receive fewer tokens

Description: The `swapExactOutput` function does not include any sort of slippage protection. This function is similar to what is done in `TSwapPool::swapExactInput`, where the function specifies a `minOutputAmount`, the `swapExactOutput` function should specify a `maxInputAmount`.

Impact: If market conditions change before the transaction processes, the user could get a much worse swap.

Proof of Concept: 1. The price of WETH right now is 1,000 USDC 2. User inputs a `swapExactOutput` looking for 1 WETH 1. inputToken = USDC 2. outputToken = WETH 3. outputAmount = 1 4. deadline = whatever 3. The function does not offer a maxInput amount 4. As the transaction is pending in the mempool, the market changes 5. The price moves MASSIVELY from 1 WETH = 10,000 USDC 6. Now user sent protocol 10,000 USDC instead of the expected 1,000 USDC

Recommended Mitigation: We should include a maxInputAmount so the user only has to spend up to a specific amount, and can predict how much they will spend on the protocol

```
1  function swapExactOutput(
2          IERC20 inputToken,
3  +       uint256 maxInputAmount,
4  .
5  .
6  .
7          inputAmount = getInputAmountBasedOnOutput(outputAmount,
               inputReserves, outputReserves);
8  +       if(inputAmount > maxInputAmount){
9  +           revert();
10 +       }
11         _swap(inputToken, inputAmount, outputToken, outputAmount);
```

[H-3] In `TSwapPool::_swap` the extra tokens given to users after every `swapCount` breaks the protocol invariant of `x * y = k`

Description: The protocol follows a strict invariant of `x * y = k`. Where:

- `x`: The balance of the pool token
- `y`: The balance of WETH
- `k`: The constant product of the two balances

This means that whenever the balances change in the protocol, the ratio between the two amounts should remain constant, hence the `k`. However, this is broken due to the extra incentive in the `_swap` function. Meaning that over time the protocol funds will be drained.

The following block of code is responsible for the issue.

```
    swap_count++;
    // Fee-on-transfer
    if (swap_count >= SWAP_COUNT_MAX) {
        swap_count = 0;
        outputToken.safeTransfer(msg.sender, 1_000_000_000_000_000_000)
            ;
    }
```

Impact: A user could maliciously drain the protocol of funds by doing a lot of swaps and collecting the extra incentive given out by the protocol.

Most simply put, the protocol's core invariant is broken.

Proof of Concept: 1. A user swaps 10 times, and collects the extra incentive of `1_000_000_000_000_000_000` 2. That user continues to swap until all of the protocol funds are drained

Proof Of Code

Place the following into `TSwapPool.t.sol`:

```
    function testInvariantBroken() public {
        vm.startPrank(liquidityProvider);
        weth.approve(address(pool), 100e18);
        poolToken.approve(address(pool), 100e18);
        pool.deposit(100e18, 100e18, 100e18, uint64(block.timestamp));
        vm.stopPrank();

        uint256 outputWeth = 1e17;

        vm.startPrank(user);
        poolToken.approve(address(pool), type(uint256).max);
        poolToken.mint(user, 100e18);
        pool.swapExactOutput(poolToken, weth, outputWeth, uint64(block.
            timestamp));
        pool.swapExactOutput(poolToken, weth, outputWeth, uint64(block.
            timestamp));
        pool.swapExactOutput(poolToken, weth, outputWeth, uint64(block.
            timestamp));
        pool.swapExactOutput(poolToken, weth, outputWeth, uint64(block.
            timestamp));
        pool.swapExactOutput(poolToken, weth, outputWeth, uint64(block.
            timestamp));
        pool.swapExactOutput(poolToken, weth, outputWeth, uint64(block.
            timestamp));
```

```
19          pool.swapExactOutput(poolToken, weth, outputWeth, uint64(block.
               timestamp));
20          pool.swapExactOutput(poolToken, weth, outputWeth, uint64(block.
               timestamp));
21          pool.swapExactOutput(poolToken, weth, outputWeth, uint64(block.
               timestamp));
22
23          int256 startingY = int256(weth.balanceOf(address(pool)));
24          int256 expectedDeltaY = int256(-1) * int256(outputWeth);
25
26          pool.swapExactOutput(poolToken, weth, outputWeth, uint64(block.
               timestamp));
27          vm.stopPrank();
28
29          uint256 endingY = weth.balanceOf(address(pool));
30          int256 actualDeltaY = int256(endingY) - int256(startingY);
31          assertEq(actualDeltaY, expectedDeltaY);
32      }
```

Recommended Mitigation: Remove the extra incentive. If you want to keep this in, we should account for the change in the x * y = k protocol invariant. Or, we should set aside tokens in the same way we do for fees.

```
1 -         swap_count++;
2 -         // Fee-on-transfer
3 -         if (swap_count >= SWAP_COUNT_MAX) {
4 -             swap_count = 0;
5 -             outputToken.safeTransfer(msg.sender, 1
      _000_000_000_000_000_000);
6 -         }
```

Medium

[M-1] `TSwapPool::deposit` is missing deadline check causing transactions to complete even after the deadline

Description: The `deposit` function accepts a deadline parameter, which according to the documentation is "The deadline for the transaction to be completed by". However, this parameter is never used. As a consequence, operations that add liquidity to the pool might be executed at unexpected times, in market conditions where the deposit rate is unfavorable.

Impact: Transactions could be sent when market conditions are unfavorable to deposit, even when adding a deadline parameter.

Proof of Concept: The `deadline` parameter is unused.

Recommended Mitigation: Consider making the following change to the function.

```
function deposit(
        uint256 wethToDeposit,
        uint256 minimumLiquidityTokensToMint,
        uint256 maximumPoolTokensToDeposit,
        uint64 deadline
    )
        external
+       revertIfDeadlinePassed(deadline)
        revertIfZero(wethToDeposit)
        returns (uint256 liquidityTokensToMint)
    {
```

Low

[L-1] `TSwapPool::LiquidityAdded` event has parameters out of order causing event to emit incorrect information

Description: When the `LiquidityAdded` event is emitted in the `TSwapPool::_addLiquidityMintAndTrans` function, it logs values in an incorrect order. The `poolTokensToDeposit` value should go in the third parameter position, whereas the `wethToDeposit` value should go second.

Impact: Event emission is incorrect, leading to off-chain functions potentially malfunctioning.

Recommended Mitigation:

```
- emit LiquidityAdded(msg.sender, poolTokensToDeposit, wethToDeposit);
+ emit LiquidityAdded(msg.sender, wethToDeposit, poolTokensToDeposit);
```

Informationals

[I-1] `PoolFactory::PoolFactory__PoolDoesNotExist` is not used and should be removed

```
-   error PoolFactory__PoolDoesNotExist(address tokenAddress);
```

[I-2] Lacking zero address checks

```
    constructor(address wethToken){
+       if(wethToken == address(0)){
+           revert();
+       }
        i_wethToken = wethToken;
```

```
6         }
```
